ENTERPRISE MOBILITY MANAGEMENT

# Managing Mobility for Retail

## Mobility is changing the retail landscape

Mobility is impacting the consumer's shopping experience, and is touching every part of the retail ecosystem. Retailers are creating 'omnichannel' strategies that are driving more mobile devices and applications to improve the timely delivery of goods resulting in increased customer satisfaction. SOTI provides a 360° view across the entire retail value chain. We help streamline retail operations, protect regulated data, and empower employees to keep pace with the customer's changing demands. SOTI helps you make your sales.

# Why SOTI for Retail?

## Make Mobility Part of your Retail Operations

Retailers are looking to do more with their mobile devices. They want to deploy and manage company software, applications and content through a centralized, configurable and scalable system.

SOTI device management features enable zero-touch configuration for the rapid staging and provisioning of consumer-grade and rugged devices. SOTI App Package Delivery gets the right application to the right employee on the right device - quickly and securely.

## Protect your Retail Regulated Data

Retailers are expanding the use of mobile devices across their operations. Smartphones and tablets are being used for accepting payments in retail locations. Mobile devices used as Point of Sale terminals (POS) must adhere to the PCI-DSS standard to protect customer data.

SOTI helps retailers meet the requirements mandated by the PCI Mobile Payment Acceptance Security Guidelines.

## Fast and Easy Device Provisioning

Getting properly configured new devices into the hands of your employees can be slow and costly. And once these devices are in the stores, updating them can be an even bigger pain.

SOTI makes device deployment and updating fast and easy. MobiControl Stage gets one, or hundreds of devices configured and ready to go in minutes. SOTI also delivers quick provisioning for smart peripherals such as connected printers. SOTI provides enterprises with cost savings by speeding the deployment and provisioning of new devices.

## Devices in the Aisles

New peripherals, new attachments and new applications are extending the reach of retail mobile devices into the aisles. Self-serve kiosks provide stock and product information and mobile POS terminals allow retail workers to make sales face to face with the customer away from the till. This can improve the customer sales experience and increase revenue per customer.

SOTI improves the management and security of these devices by enforcing authentication, and adding data encryption. In addition, SOTI Location Service and geo-fencing features can restrict or lockdown devices that leave the premises.

# Bringing it All Together

Every day you hear about amazing new technologies, mobile devices, and software, but true disruption will not come from a single 'thing', mobile device, or application. Revolutionary advances in retail will arise from bringing all of the pieces together to fundamentally change the shopping experience.

- *Mobile technology can enhance the shopping experience before your customer even enters the store.*
- *Branded applications on mobile devices can deliver daily or weekly e-flyers to user's smartphone.*
- *When shoppers are walking around the mall, beacons can advertise "walk-in" specials based on their purchase history and entice them into the store.*
- *Digital signage will direct the shopper to products that they are most likely to purchase and beacons can trigger to offer promotions based on proximity*
- *In the aisles, single-purpose devices in kiosk mode can provide product information, check inventory, or order stock and once the shopper is ready to checkout, mobile sales staff with mPOS enabled devices can scan their purchase, swipe their credit card and print their receipt on the mobile smart printer attached to their belt.*

Tying all of these systems together plus managing their connections and keeping them secure is difficult. SOTI makes it easy to manage all the different types of mobile devices and their security, applications, and content. As the Internet of Things grows, we will continue to provide industry leading mobility management for all endpoints, whether you wear it, carry it or drive it.
